Mon Tue Wed Thu Fri Sat

Date: / / 20

6, 8, 9, 10

106, 107, 76, 82, 109, 107, 115, 93, 187

95, 123, 125, 111, 92, 86, 70, 126, 168

130, 129, 139, 119, 115, 128, 100, 186, 84

99, 113, 204, 111, 141, 136, 123, 90, 115,

98, 110, 78, 185, 162, 178, 140, 152, 173,

146, 158, 194, 148, 90, 107, 181, 131, 75

184, 104, 110, 80, 118, 82

$$204 - 68 = 136$$

No. of class: $K = 1 + 3.3 \log N$

N = no. of observations

$$= 1 + 3.3 \log(60)$$

$$= 6.87$$

$$\approx 7$$

$$\text{For classes width interval} = \frac{136}{7} = 19.47 \approx 20$$

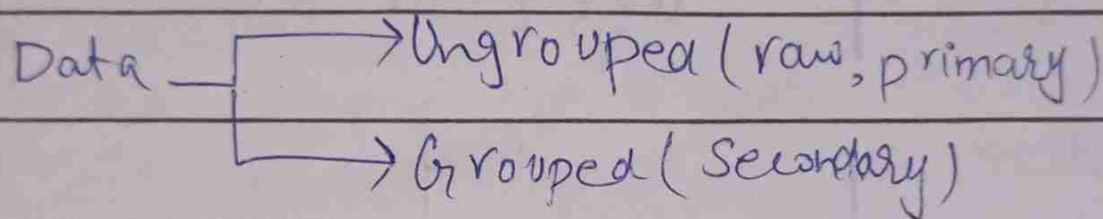

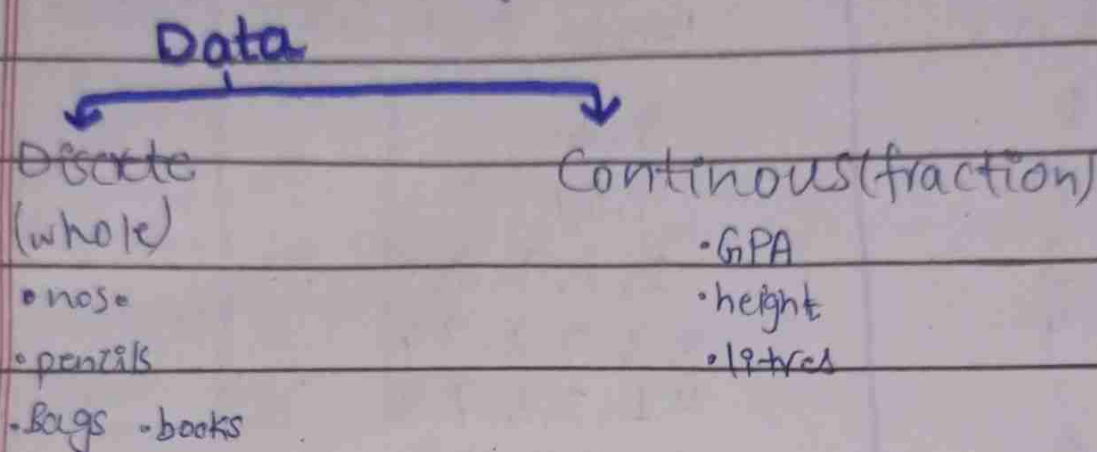

So classes are:

Weights	Tally	f	Class Boundaries	cumulative frequency	Class marks
68-87		10	67.5-87.5	10	77.5
88-107		13	87.5-107.5	10+13=23	97.5
108-127		15	107.5-127.5	23+15=38	117.5
128-147		9	127.5-147.5	38+9=47	137.5
148-167		4	147.5-167.5	47+4=51	157.5
168-187		7	167.5-187.5	51+7=58	177.5
188-207		2	187.5-207.5	58+2=60	197.5
Total		$\Sigma f = 60$			

→ When upper class of one class and lower class of next class is different, it is called "class limits."

Primary = raw data, initial

Secondary = After applying tools, data become secondary.

Class Boundaries = upper class or lower class

ke difference nikalo and then divide it to 2. and - it to lower class and add it upper class. To identify the class boundaries upper class of previous class and lower class of next class is same

→ Example 2.3, 2.4, 2.5, 2.7, 2.8

Stem-leaf display :-

14	0

- ③ Represent total expenditure & expenditures on various items of a family by pie diagram.

Items	Expenditure (Rs.)	Angles
Foods	50	120
Clothing	30	72
Rent/Hous	20	48
Fuel & light	15	36
Misc	35%	84
	150	360

$$\text{Angle} = \frac{\text{Component Part}}{\text{Whole Quantity}} \times 360^\circ$$

- Angles of all column is must be 360 ← sum

Histogram

- ① Construct a histogram for following frequency dist relating to ages of telephones operators.

- Quantity and over year

Ans. of something = frequency

• Histogram me class boundaries must be

Mon Tue Wed Thu Fri Sat

Date: 1 / 120

Ages	No. of	Class Boundaries	Class interval	Proportional Heights
18-19	9	17.5-19.5	2	$9/2 = 4.5$
20-24	188	19.5-24.5	5	$188/5 = 37.6$
25-29	160	24.5-29.5	5	$160/5 = 32$
30-34	123	29.5-34.5	5	$123/5 = 24.6$
35-44	84	34.5-44.5	10	$84/10 = 8.4$
45-49	15	44.5-49.5	5	$15/15 = 1$

For uniform

It is When class-limit is same for all class, it is called uniform.

- in un-uniform data, frequency or proportioned weight on y-axis.

Frequency Polygon

- In this graph, midpoints or class marks(x) are compulsory.

Ages	(X)	freq
18-19	18.5	4.5
20-24	22	37.6
25-29	27	32
30-34	32	24.6
35-39	39.5	8.4
45-59	52	1

- It is related to time.

Measure of Central Tendency

1. Arithmetic Means :-

$$\bar{x} = \frac{\sum x}{n} \quad \text{Ungrouped} \quad n = \text{no. of observations in data}$$

$$\bar{x} = \frac{\sum (fx)}{\sum f} \quad \text{grouped} \quad n = \sum f; \quad \bar{x} = \frac{\sum (fx)}{n}$$

2. Change of origin & scale method; Coding method

$$\bar{x} = a + \frac{\sum f \cdot u}{\sum f} \times h \quad \text{where}$$

$$u = \frac{x - a}{h} \quad a = \text{any random value from } x$$

$$h = \text{class interval}$$

$$\bar{x} = a + \frac{\sum u \times h}{n} \quad \text{for ungrouped data.} \quad \text{Q2}$$

3. Geometric mean :-

$$G = \text{antilog} \left[\frac{1}{\sum f} \sum f \log x \right] \rightarrow \text{grouped}$$

$$G = \text{antilog} \left[\frac{1}{n} \sum \log x \right] \rightarrow \text{ungrouped data}$$

4. Harmonic mean :-

$$H = \frac{\sum f}{\sum f \left(\frac{1}{x} \right)} \rightarrow \text{grouped}$$

$$H = \frac{n}{\sum \left(\frac{1}{x} \right)} \rightarrow \text{ungrouped data}$$

Class limits	f	C.B	x	fx	$u = \frac{x - \bar{x}}{h}$	fu	$\log x$	$f \log x$
68-87	10	67.5-87.5	77.5	775	$\frac{77.5 - 137.5}{20} = -3$			
88-107	13	87.5-107.5	97.5	1267.5	-2			
108-127	15	107.5-127.5	117.5	1762.5	-1			
128-147	9	127.5-147.5	137.5	1237.5	0			
148-167	4	147.5-167.5	157.5	630	1			
168-187	7	167.5-187.5	177.5	1242.5	2			
188-207	2	187.5-207.5	197.5	395	3			
$\Sigma f = 60$				$\Sigma fx = 7310$				$\Sigma f \log x = 124.1695$
$\bar{x} = \frac{7310}{60} = 121.8$								
$h = 20$								
$\bar{x} = 137.5 + \frac{-47}{60} \times 20 = 121.8$								

Friday

② Graph following data showing areas in millions of square miles of the ocean? of the world using pie chart.

Ocean	Area	Angles
Pacific	70.8	167
Atlantic	41.2	97
Indians	28.5	67
Antarctic	7.6	18
Arctic	4.8	11
	153	360

Angles = $\frac{\text{Component Part}}{\text{Whole quantity}} \times 360^\circ$

So data is uniform

Let $a_0 = 52$
 $h = 5$

2

Weekly Income	No. of students	x	$u = \frac{x - a_0}{h}$	fu
35 - 39	15	37	-3	-45
40 - 44	18	42	-2	-36
45 - 49	17	47	-1	-17
50 - 54	29	52	0	0
55 - 59	11	57	1	11
60 - 64	10	62	2	20
65 - 69	5	67	3	15
	$\Sigma f = 100$			-42

For Grouped Data:-

$$\bar{x} = a_0 + \frac{\Sigma fu}{\Sigma f} \times h$$

$$= 52 + \frac{-42}{100} \times 5 = 50$$

Median: is a value which divide ur data in 2 equal parts. median is not necessary in ur given data. It may be in ur range.

2 4 3 7 5
5 is median!

$$\text{median} = l + \frac{h}{f_m} \left(\frac{n}{2} - c \right)$$

h → class interval

f_m → freq of median class

l → lower class boundary of median class

$\frac{\sum f}{n}$ →

c → cumulative frequency above median class

Median class = $n/2$ → answer check into Cf column.

Mode: most frequent data.

Ungrouped data: kousi value sb se zafada he

Unimodal distribution = have only one mode

bimodal distribution = have two mode

Grouped:-

$$\text{mode} = l + \frac{f_m - f_1}{(f_m - f_1) + (f_m - f_2)} \times h$$

$= 59.5 + \frac{(304 - 190)}{(304 - 190) + (304 - 211)} \times 10$
 $= 59.5 + \frac{114}{193} = 65.1$

f_m = freq of modal class

f_1 = freq associated with class preceding with modal class

f_2 = " " " " following " "

h = class width
